

The Village of Bear Lake Lead samples collected in July 2015 show the 90th percentile of 14.5 parts per billion in one liter. The Village is in compliance with MDEQ & EPA Lead Regulations. There was one sample taken from a seasonal home that showed a lead concentration that was higher than in the past. The Village is investigating the plumbing and sampling protocol to determine why this happened. The final report will be available for public review when it is submitted to the MDEQ later this month.
